

Convenient storage. Quality craftsmanship.

These elegant, furniture-quality wood pellet sifters are the perfect solution for your wood pellet storage needs.

Because wood pellets are a low-emission renewable fuel source, pellet stoves are gaining in popularity as an appealing alternative to natural gas or petroleum powered heaters.

Wood pellets are an environmentally friendly heating source utilizing wood waste that would otherwise be sent to landfills. Pellets are often made from sawdust and other small wood particles generated when wood is logged, milled, recycled, or processed by furniture or paper manufacturers. This makes the small pellets easier to store and dispense than chopped wood.

Our custom-made storage units hold three 40-pound bags of pellets conveniently dispensing them down a mesh chute designed to sift out the dust which results from the handling of wood pellets.

Removing the pellet dust prevents the formation of clinkers and dust build-up that is harmful to the stove, allowing the stove to function efficiently.

The sifted dust is collected at the base of the unit in a drawer that is easily removed for emptying.

Creative Woodworking wood pellet sifters are hand-crafted from birch and alder wood and contain no engineered wood products.

See reverse side for details about size and available finishes.
